BUFF FIT PROJECT

Features Completed: Login Page, Home Page, and Database Setup/Credential Recognition.

What Worked during Demo: Beautiful Login screen, Signing up a user through Firebase (will continue to implement sign up option from login screen), logging in user through login screen, Transition to Home Page after logging in (currently done by a button click will be changed to automatically change pages after logging in). Log out function also worked during demo (will add functionality to clear input fields after logged out).

Issues Faced: Transition pages after button click rather than clicking a link. Adjusting background image while maintaining image quality. Setting up Firebase backend. Implementing signup option in app.

TA Suggestions: Can utilize lab 7 as a guide moving forward. MongoDB if going node route of backend. Mac also has a PostgreSQL app that is not too difficult to use.
